crypto-timing-attack-detector: one file, four timed operations

Errors: ValueError and other failures are logged and the program exits 1 (commit ded5ce3).
No distribution test, no verdict: the average demonstrates measurement only.

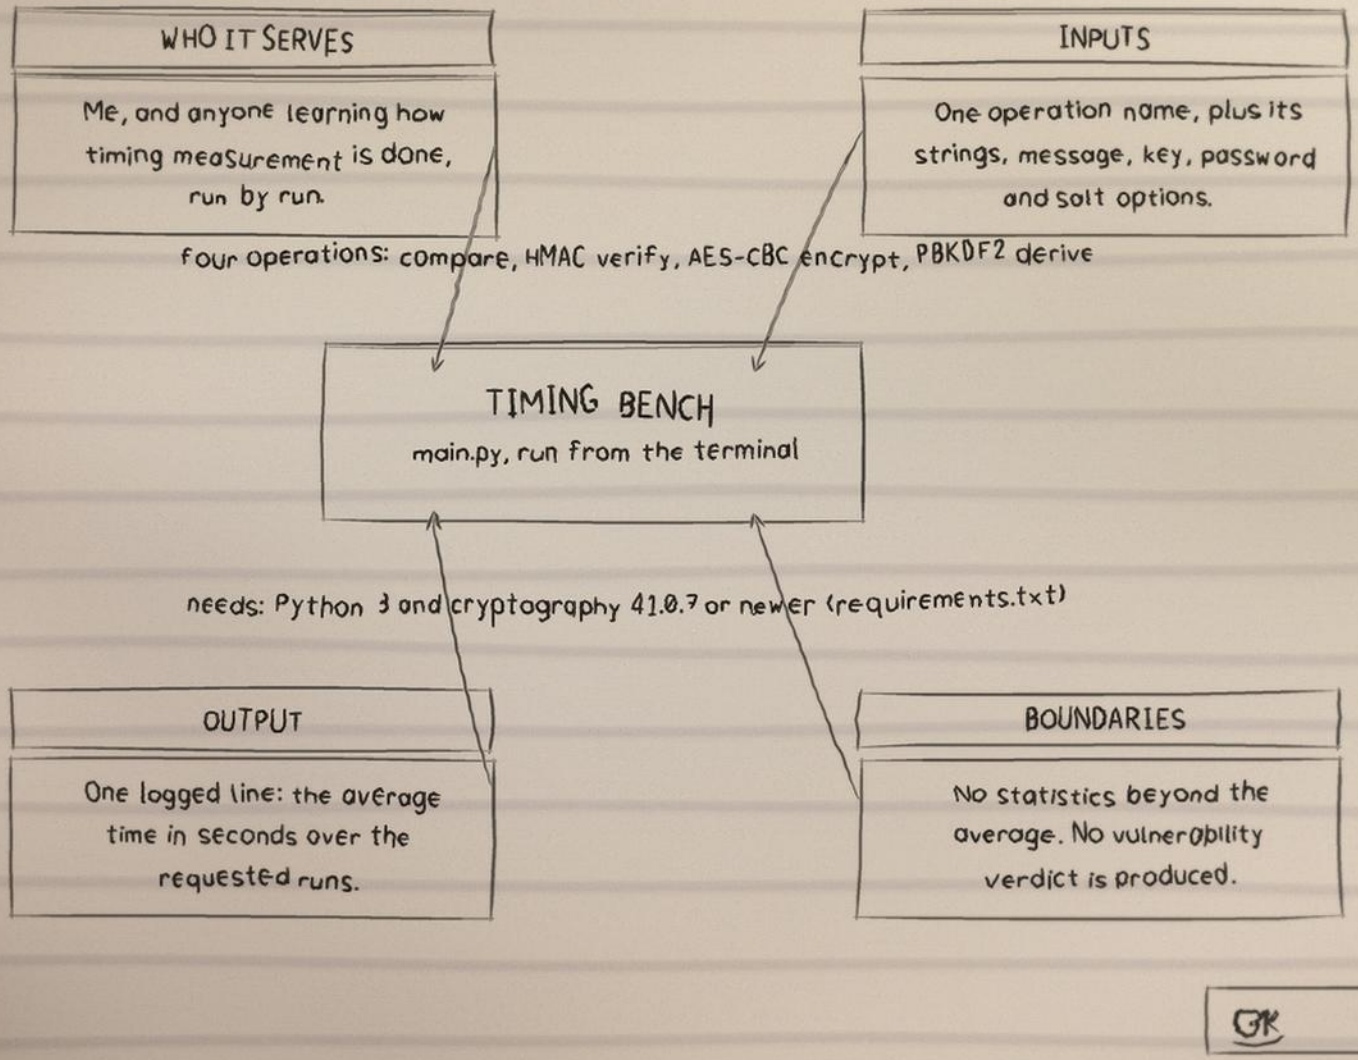

timing bench tag, OK

One run of main.py, step by step

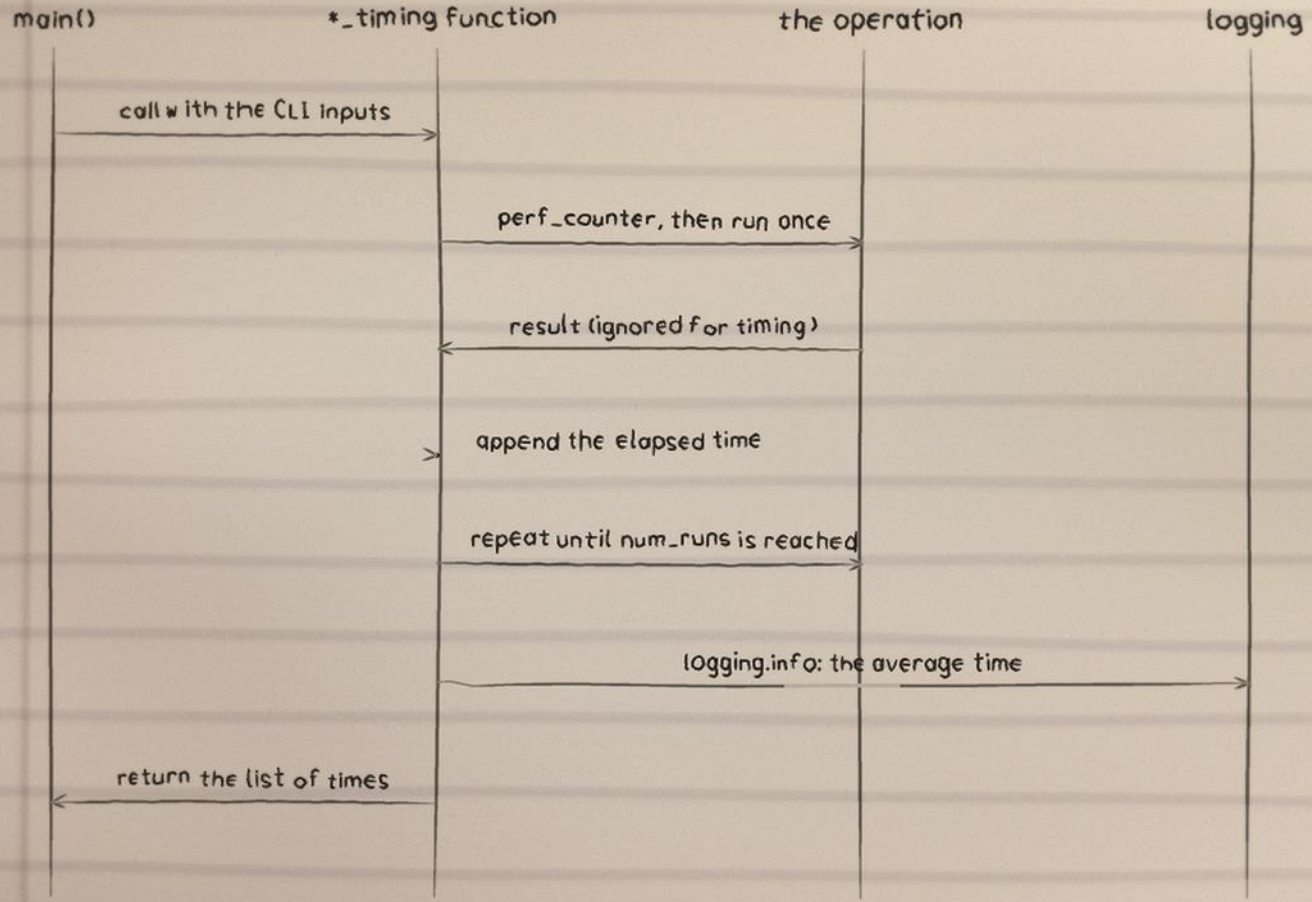

A failed PBKDF2 derivation is not caught inside its timing function. It rises to main(), which logs it and exits 1.

Product map: a small timing bench, honestly bounded

GK

Sequence: what happens inside one timed run

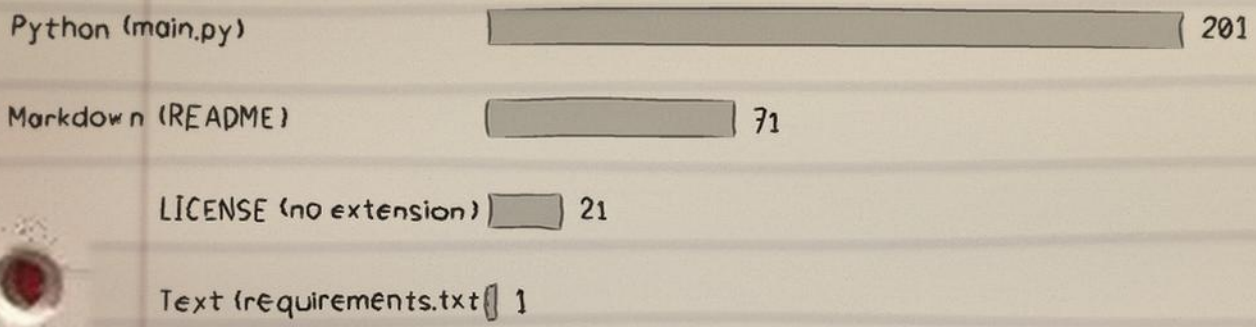

Setup differs per operation: HMAC builds its value first, AES pads and makes one IV first, PBKDF2 builds a fresh KDF each

bench notes checked,

crypto-timing-attack-detector in numbers, 2026-10-30

Lines by file kind over tracked files, binary images excluded. Method in VISUAL.md.

6 tracked files, 8 commits. First commit 2025-04-13, last 2026-10-30, from git log.
Tests: none bundled, and the README says so. No test pass is claimed.
Run attempt 2026-10-30: main.py stopped at import, cryptography is not installed here.
